

The System

Coprocess has been developing multilateral netting systems for over 25 years. During that time there has been four major changes in technology. Each change has brought new challenges but also new choices. By thinking about how the system works and what each component does, it has allowed us to bring a new, better system to our clients with each change.

Because we have so many clients we are continually putting our energy and enthusiasm into our intercompany software. Whether this is for Reconciliation, Multilateral or Bilateral Netting or paying third party suppliers with the Vendor Payments module, we spend time designing, developing, testing, implementing and supporting our system. If a client wants a new feature we will work with the client to design and develop it. If it is a feature all clients are likely to need we may well develop it free of charge and make it available to all our clients.

To learn more about the system and why secure access for the business units via the internet is the best model of intercompany netting see our pages on [hosting](#), [technology](#) and [security](#).
